Informed Consent for Applied Kinesiology and Related Therapies

Doctors of chiropractic who use techniques studied at a post graduate level, not common to undergraduate chiropractic education are required to inform patients of this.

All chiropractors use standard methods of assessment including a thorough history and physical examination, (neurological, orthopedic and chiropractic tests) and if needed radiological studies.

As understood by most patients seeking chiropractic care, chiropractors use spinal adjustments to correct biomechanics; thus improving posture, function and relieving pain. There are various methods of adjusting the spine and chiropractors though the most thoroughly trained are not the only licensed practitioners who manipulate the joints of the spine and extremities.

It is common for chiropractors to use soft tissue therapies, counsel in exercise, diet and lifestyle and apply therapeutic modalities such as ultrasound, electro stimulation and laser therapies.

In this office, Dr. Grossman apply all of the above in addition to using a therapeutic model based on Applied Kinesiology. Applied Kinesiology or AK (not to be confused with Kinesiology studied in university) is a system of assessment and therapy based on the original insights of George Goodheart D.C. And used by thousands of Chiropractor, Osteopaths, Physicians and Dentists around the world. The hallmark of AK is the manual muscle test and it is used to detect biomechanical dysfunction, neurological impedance, acupuncture meridian imbalance, metabolic involvement and stress/lifestyle issues.

After forming a clinical impression from standard examination and AK assessment, therapy is directed to restoring balance and function. Chiropractic and therapies studied in standardized AK seminars or found in AK literature are used. These include cranial therapy, lymphatic/vascular reflex stimulation, acupuncture meridian therapy, neurological organization, functional biochemistry and stress related therapies.

Risks involved in AK are minimal but could involve pain from minor strain to muscles in the poorly conditioned or elderly patient from repeated muscle testing.

I consent to the therapy as discussed above. I intend this consent to apply to all my present and future care.
